

# Server Consolidation Assessment

## Deliverables

Bell Industries will provide specific information on:

- Server consolidation analysis and cost justification
- Server consolidation architecture, hardware designs, and roadmap
- Server consolidation full project execution

## Time On-site

Approximately 3-5 days, depending on size and complexity of the datacenter and geographic diversity.

## Cost

Bell Industries server consolidation solutions are delivered as managed project engagements, and are priced individually based upon customer requirements and objectives. Bell Industries offers project justification and budget creation services for customers requiring accurate costing information prior to project commencement.

## Description

As organizations have steadily migrated business functions away from mid-range and mainframe systems to WINTEL platform systems, server populations within IT shops have increased dramatically and often without sufficient planning and architecture. In most cases, this practice increases operational costs as well as the management challenges associated with unnecessarily high server counts.

Bell Industries provides server evaluation, design, and implementation solutions to help organizations lower costs, reduce management challenges, and improve overall performance.

With expertise in systems architecture, server hardware, application migration, storage consolidation, and security, Bell Industries provides all the ingredients required to safely, cost effectively, and efficiently focus business functionality on “right-sized” server populations.

## Benefits

Bell Industries’ Server Consolidation Assessment will:

- Provide consolidation design options
- Provide space, heat, and power analysis
- Provide ROI justification

Bell Industries’ highly trained team of objective professionals will help your organization understand whether consolidation is right for you. Contact your Bell Industries Account Manager today for more details.
